**ComicCraft – AI-Powered Story to Comic Generator**

**Naan Mudhalvan Project Development Documentation**

**Project Name:** ComicCraft
**Project Type:** AI-Powered Application
**Domain:** Artificial Intelligence, Natural Language Processing, and Visual Storytelling
**Documentation Folder:** 5_Project_Development
**Documentation File:** README.md
**Core Workflow:** Story Input → Story Processing → Comic Panel Generation → Final Comic

---

**1. Introduction**

ComicCraft is an AI-assisted application designed to transform written stories into visually engaging comic panels. The application accepts a story from the user, analyzes its content, divides it into meaningful scenes, prepares descriptions for individual comic panels, generates or retrieves illustrations, integrates dialogue and captions, and assembles the panels into a final comic.

The development process focuses on implementing these components as a coordinated workflow. Each module performs a specific task and passes its output to the next module until the final comic is ready for display.

This document describes the proposed development structure, implementation stages, module responsibilities, data flow, integration approach, error handling, testing strategy, and expected results.

The exact programming languages, libraries, AI models, and APIs should be documented according to the technologies actually used in the ComicCraft implementation.

**2. Project Overview**

Traditional comic creation involves writing a story, planning scenes, designing characters, creating illustrations, adding dialogue, and arranging the panels. These activities can require considerable time and artistic expertise.

ComicCraft aims to simplify this process by automating important stages of comic creation.

The application takes a written narrative as input and transforms it into an ordered sequence of visual scenes. Each scene becomes a comic panel containing an illustration, dialogue, caption, or other relevant information. The generated panels are then assembled into a complete comic.

The development objective is to build a maintainable application in which story processing, panel generation, illustration handling, and comic assembly work together efficiently.

**3. Problem Statement**

Users may have creative story ideas but lack the drawing skills, design tools, or time needed to convert
